Please delete the current Abstract in its entirety and substitute therefor the enclosed New Abstract.

NEW ABSTRACT

A shaving apparatus has at least one shaving head with at least one cutter, a trimmer, and a drive structure including a motor for driving the cutter or cutters and the trimmer. The trimmer is disengageable from the drive structure. At least a portion of the drive structure may be rotated in reverse directions between a first sense of rotation and a second, opposite, sense of rotation. A unidirectional clutch is arranged between the portion of the drive structure of which the sense of rotation is reversible and the cutter or cutters. When the sense of rotation is reversed from the sense of rotation in which the cutter or cutters is driven, the trimmer may be driven without driving the cutter or cutters.
